Features

- Dual channel 64 ms or single channel 128 ms echo cancellation
- Conforms to ITU-T G. 165 requirements
- ITU-T G.165/G. 164 disable tone detection supported on all audio paths
- Narrow-band signal detection
- Programmable double-talk detection threshold
- Non-linear processor with adaptive suppression threshold and comfort noise insertion
- Offset nulling of all PCM channels
- Controllerless mode or Controller mode with serial interface
- ST-BUS or variable-rate SSI PCM interfaces
- Selectable $\mu /$ A-Law ITU-T G.711; $\mu /$ A-Law Sign Mag; linear 2's complement
- Per channel selectable 12 dB attenuator
- Transparent data transfer and mute option
- 19.2 MHz master clock operation

## Applications

- Wireless Telephony
- Trunk echo cancellers

## Description

The MT9122 Voice Echo Canceller implements a cost effective solution for telephony voice-band echo cancellation conforming to ITU-T G. 165 requirements. The MT9122 architecture contains two echo cancellers which can be configured to provide dual channel 64 millisecond echo cancellation or single channel 128 millisecond echo cancellation. The MT9122 supports ITU-T G. 165 or G. 164 tone disable requirements.

The MT9122 operates in two major modes: Controller or Controllerless. Controller mode allows access to an array of features for customizing the MT9122 operation. Controllerless mode is for applications where default register settings are sufficient.

Figure 2 - Pin Connections

## Pin Description

| Pin \# | Name | Description |
| :---: | :---: | :---: |
| 1 | ENA1 | SSI Enable Strobe / ST-BUS Mode for Rin/Sout (Input). This pin has dual functions depending on whether SSI or ST-BUS is selected. <br> For SSI, this strobe must be present for frame synchronization. This is an active high channel enable strobe, 8 or 16 data bits wide, enabling serial PCM data transfer for Echo Canceller A on Rin/Sout pins. Strobe period is 125 microseconds. <br> For ST-BUS, this pin, in conjunction with the ENB1 pin, will select the proper ST-BUS mode for Rin/Sout pins (see ST-BUS Operation description). The selected mode applies to both Echo Canceller A and B. |
| 2 | ENB1 | SSI Enable Strobe / ST-BUS Mode for Rin/Sout (Input).This pin has dual functions depending on whether SSI or ST-BUS is selected. <br> For SSI, this is an active high channel enable strobe, 8 or 16 data bits wide, enabling serial PCM data transfer for Echo Canceller B on Rin/Sout pins. Strobe period is 125 microseconds. <br> For ST-BUS, this pin, in conjunction with the ENA1 pin, will select the proper ST-BUS mode for Rin/Sout pins (see ST-BUS Operation description). The selected mode applies to both Echo Canceller A and B. |
| 3 | ENA2 | SSI Enable Strobe / ST-BUS Mode for Sin/Rout (Input).This pin has dual functions depending on whether SSI or ST-BUS is selected. <br> For SSI, this is an active high channel enable strobe, 8 or 16 data bits wide, enabling serial PCM data transfer for Echo Canceller A on Sin/Rout pins. Strobe period is 125 microseconds. <br> For ST-BUS, this pin, in conjunction with the ENB2 pin, will select the proper ST-BUS mode for Sin/Rout pins (see ST-BUS Operation description). The selected mode applies to both Echo Canceller A and B. |
| 4 | ENB2 | SSI Enable Strobe / ST-BUS Mode for Sin/Rout (Input).This pin has dual functions depending on whether SSI or ST-BUS is selected. <br> For SSI, this is an active high channel enable strobe, 8 or 16 data bits wide, enabling serial PCM data transfer for Echo Canceller B on Sin/Rout pins. Strobe period is 125 microseconds. <br> For ST-BUS, this pin, in conjunction with the ENA2 pin, will select the proper ST-BUS mode for Sin/Rout pins (see ST-BUS Operation description). The selected mode applies to both Echo Canceller A and B. |

## Pin Description (continued)

| Pin \# | Name | Description |
| :---: | :---: | :--- |
| $\mathbf{5}$ | Rin | Receive PCM Signal Input (Input). 128 kbit/s to 4096 kbit/s serial PCM input stream. Data <br> may be in either companded or 2's complement linear format. Two PCM channels are time- <br> multiplexed on this pin. These are the Receive Input reference channels for Echo Cancellers A <br> and B. Data bits are clocked in following SSI or ST-BUS timing requirements. |
| $\mathbf{6}$ | Sin | Send PCM Signal Input (Input). 128 kbit/s to 4096 kbit/s serial PCM input stream. Data <br> may be in either companded or 2's complement linear format. Two PCM channels are time- <br> multiplexed on this pin. These are the Send Input channels (after echo path) for Echo <br> Cancellers A and B. Data bits are clocked in following SSI or ST-BUS timing requirements. |
| $\mathbf{7}$ | VSS | Digital Ground: Nominally 0 volts. |
| $\mathbf{8}$ | MCLK | Master Clock (Input): Nominal 20 MHz Master Clock input. May be connected to an <br> asynchronous (relative to frame signal) clock source. |
| $\mathbf{9}$ | IC | Internal Connection (Input): Must be tied to Vss. |
| $\mathbf{1 0}$ | NLP | Non-Linear Processor Control (Input): <br> Controllerless Mode: An active high enables the Non-Linear Processors in Echo Cancellers A <br> Cond B. Both NLP's are disabled when low. Intended for conformance testing to G.165 and it is <br> usually tied to Vdd for normal operation. <br> Controller Mode: This pin is ignored (tie to Vdd or Vss). The non-linear processor operation is |
| $\mathbf{1 1}$ | REV | Controlled by the NLPDis bit in Control Register 2. Refer to the Register Summary. |
| $\mathbf{R e v e r s a l}$ Detection (Input): |  |  |
| Controllerless Mode: An active high configures all the tone detectors to trigger only when a |  |  |
| 2100Hz disable tone with periodic phase reversal is present (per G.165). When low, the tone |  |  |
| detectors will trigger upon detection of any 2100Hz disable tone, with or without periodic |  |  |
| phase reversal (per G.164). |  |  |
| Controller Mode: This pin is ignored (tie to VDD or VSS). The operation is controlled by the |  |  |$|$| Condis bit in Control Register 2. Refer to the Register Summary. |

## Functional Description

The MT9122 architecture contains two individually controlled echo cancellers (Echo Canceller A and B). They can be set in three distinct configurations: Normal, Back-to-Back and Extended Delay (see Figure 3). Under Normal configuration, the two echo cancellers are positioned in parallel providing 64 millisecond echo cancellation in two channels simultaneously. In Back-to-Back configuration, the two echo cancellers are positioned to cancel echo coming from both directions in a single channel. In Extended-Delay configuration, the two echo cancellers are internally cascaded into one 128 millisecond echo canceller.

Each echo canceller contains the following main elements (see Figure 1).

- Adaptive Filter for estimating the echo channel
- Subtracter for cancelling the echo
- Double-Talk detector for disabling the filter adaptation during periods of double-talk
- Non-Linear Processor for suppression of residual echo
- Disable Tone Detectors for detecting valid disable tones at the input of receive and send paths
- Narrow-Band Detector for preventing Adaptive Filter divergence caused by narrow-band signals
- Offset Null filters for removing the DC component in PCM channels
- 12 dB attenuator for signal attenuation
- Serial controller interface compatible with Motorola, National and Intel microcontrollers
- PCM encoder/decoder compatible with $\mu / \mathrm{A}$-Law ITU-T G.711, $\mu /$ A-Law Sign-Mag or linear 2's complement coding

The MT9122 has two modes of operation: Controllerless and Controller. Controllerless mode is intended for applications where customization is not required. Controller mode allows access to all registers for customizing the MT9122 operation. Refer to Table 7 for a complete list. Controller mode is selected when CONFIG1 and CONFIG2 pins are both connected to Vss.

Each echo canceller in the MT9122 has four functional states: Mute, Bypass, Disable Adaptation and Enable Adaptation. These are explained in the section entitled Echo Canceller Functional States.

Figure 3 - Device Configuration

## Adaptive Filter

The adaptive filter is a 1024 tap FIR filter which is divided into two sections. Each section contains 512 taps providing 64 ms of echo estimation. In Normal configuration, the first section is dedicated to channel $A$ and the second section to channel $B$. In Extended Delay configuration, both sections are cascaded to provide 128 ms of echo estimation in channel A.

## Double-Talk Detector

Double-Talk is defined as those periods of time when signal energy is present in both directions simultaneously. When this happens, it is necessary to disable the filter adaptation to prevent divergence of the adaptive filter coefficients. Note that when double-talk is detected, the adaptation process is halted but the echo canceller continues to cancel echo.

A double-talk condition exists whenever the Sin signal level is greater than the expected return echo level. The relative signal levels of Rin (Lrin) and Sin (Lsin) are compared according to the following expression to identify a double-talk condition:

$$
L \sin >L r i n+20 \log _{10}(D T D T)
$$

where DTDT is the Double-Talk Detection Threshold. Lsin and Lrin are the relative signal levels expressed in dBm .

A different method is used when it is uncertain whether Sin consists of a low level double-talk signal or an echo return. During these periods, the adaptation process is slowed down but it is not halted.

## Controllerless Mode

In G. 165 standard, the echo return loss is expected to be at least 6dB. This implies that the Double-Talk Detector Threshold (DTDT) should be set to 0.5 (-6dB). However, in order to get additional guardband, the DTDT is set internally to 0.5625 (-5dB). In controllerless mode, the Double-Talk Detector is always active.

## Controller Mode

In some applications the return loss can be higher or lower than 6dB. The MT9122 allows the user to change the detection threshold to suit each application's need. This threshold can be set by writing the desired threshold value into the DTDT register.

The DTDT register is 16 bits wide. The register value in hexadecimal can be calculated with the following equation:

$$
D T D T_{(h e x)}=h e x\left(D T D T_{(d e c)} * 32768\right)
$$

where $0<$ DTDT $_{(\text {dec })}<1$
Example: For DTDT $=0.5625(-5 d B)$, the
hexadecimal value becomes
hex $(0.5625$ * 32768) $=4800 \mathrm{~h}$

## Non-Linear Processor (NLP)

After echo cancellation, there is always a small amount of residual echo which may still be audible. The MT9122 uses an NLP to remove residual echo signals which have a level lower than the Adaptive Suppression Threshold (TSUP in G.165). This threshold depends upon the level of the Rin (Lrin) reference signal as well as the programmed value of the Non-Linear Processor Threshold register (NLPTHR). TSUP can be calculated by the following equation:

$$
T S U P=\operatorname{Lrin}+20 \log _{10}(N L P T H R)
$$

where NLPTHR is the Non-Linear Processor Threshold register value and Lrin is the relative power level expressed in dBm0.

When the level of residual error signal falls below TSUP, the NLP is activated further attenuating the residual signal to less than -65 dBm 0 . To prevent a perceived decrease in background noise due to the activation of the NLP, a spectrally-shaped comfort noise, equivalent in power level to the background noise, is injected. This keeps the perceived noise level constant. Consequently, the user does not hear the activation and de-activation of the NLP.

## Controllerless Mode

The NLP processor can be disabled by connecting the NLP pin to Vss.

## Controller Mode

The NLP processor can be disabled by setting the NLPDis bit to 1 in Control Register 2.

The NLPTHR register is 16 bits wide. The register value in hexadecimal can be calculated with the following equation:

$$
\operatorname{NLPTHR}_{(\text {hex })}=\operatorname{hex}\left(\operatorname{NLPTHR}_{(\text {dec })} * 32768\right)
$$

where $0<$ NLPTHR $_{(\text {dec })}<1$

The comfort noise injection can be disabled by setting the INJDis bit to 1 in Control Register 1.

It should be noted that the NLPTHR is valid and the comfort noise injection is active only when the NLP is enabled.

## Disable Tone Detector

G. 165 recommendation defines the disable tone as having the following characteristics: 2100 Hz $( \pm 21 \mathrm{~Hz})$ sinewave, a power level between -6 to $-31 \mathrm{dBm0}$, and a phase reversal of 180 degrees ( $\pm 25$ degrees) every 450 ms ( $\pm 24 \mathrm{~ms}$ ). If the disable tone is present for a minimum of one second with at least one phase reversal, the Tone Detector will trigger.
G. 164 recommendation defines the disable tone as a $2100 \mathrm{~Hz}( \pm 21 \mathrm{~Hz})$ sinewave with a power level between -6 to -31 dBm 0 . If the disable tone is present for a minimum of one second, with or without phase reversal, the Tone Detector will trigger.

The MT9122 has four Tone Detectors in order to monitor the occurrence of a valid disable tone on channels A and B on both Rin and Sin. Upon detection of a disable tone, output pins TD1 or TD2 will go low as illustrated in Figure 4.

Figure 4 - Disable Tone Detection
Once a Tone Detector has been triggered, the MT9122 no longer needs a valid disable tone (G. 164 or G.165) to maintain Tone Detector status (e.g. TD1, TD2 pins low). The Tone Detector status will only release (e.g. TD1, TD2 pins high) if the signals Rin and Sin fall below $-30 \mathrm{dBm0}$, in the frequency range of 390 Hz to 700 Hz , and below $-34 \mathrm{dBm0}$, in the frequency range of 700 Hz to 3400 Hz , for at least 400 ms .

## Controllerless Mode

The selection between G. 165 and G. 164 tone disable is controlled by the REV pin. When the REV pin is connected to Vss, G. 164 is selected. This applies to all four Tone Detectors.

In response to a valid disable tone, the MT9122 must be switched from the Enable Adaptation state to the Bypass state. In an application, the Tone Detect outputs, TD1 and TD2, may be used to switch the echo cancellers between these two states. This is achieved by connecting S1 and S3 pins to Vdd and by connecting the TD1 and TD2 outputs to the S2 and S4 input pins respectively.

## Controller Mode

The selection between G. 165 and G. 164 tone disable is controlled by the PHDis bit in Control Register 2. When the PHDis bit is set to 1, G. 164 tone disable requirements are selected. This applies to all four Tone Detectors.

In response to a valid disable tone, the MT9122 must be switched from the Enable Adaptation state to the Bypass state. This can be done in two ways, automatically or externally. In automatic mode, the Tone Detectors internally control the switching between Enable Adaptation and Bypass states. The automatic mode can be activated by setting the AutoTD bit in Control Register 2 to high. In external mode, an external controller is needed to poll the TD bit in Status Register A or B. Following the detection of a disable tone (TD bit high), the external controller should switch the echo canceller from Enable Adaptation to Bypass state.

The TD1 and TD2 output pins remain active, as in Controllerless mode, and they can be used as an interrupt to an external controller.

## Narrow Band Signal Detector (NBSD)

Single or dual frequency tones (e.g. DTMF tones) present in the reference input (Rin) of the echo canceller for a prolonged period of time may cause the adaptive filter to diverge. The Narrow Band Signal Detector (NBSD) is designed to prevent this divergence by detecting single or dual tones of arbitrary frequency, phase, and amplitude. When narrow band signals are detected, the adaptation process is halted but the echo canceller continues to cancel echo.

## Controllerless Mode

The NBSD is always active and automatically disables the filter adaptation process when narrow band signals are detected.

## Controller Mode

The NBSD can be disabled by setting the NBDis bit to 1 in Control Register 2.

## Offset Null Filter

Adaptive filters in general do not operate properly when a DC offset is present on either the reference signal (Rin) or the echo composite signal (Sin). To remove the DC component, the MT9122 incorporates Offset Null filters in both Rin and Sin inputs.

## Controllerless Mode

The Offset Null filters are always active.

## Controller Mode

The offset null filters can be disabled by setting the HPFDis bit to 1 in Control Register 2.

## Echo Canceller Functional States

Each echo canceller has four functional states: Mute, Bypass, Disable Adaptation and Enable Adaptation.

Mute:
The Mute state forces the echo canceller to transmit quiet code and halts the filter adaptation process.

In Normal configuration, the PCM output data on Rout is replaced with the quiet code according to the following table.

|  | LINEAR <br> 16 bits <br> 2's <br> complement | SIGN/ <br> MAGNITUDE <br> M-Law <br> A-Law | CCITT (G.711) |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mu$-Law | A-Law |  |  |
| +Zero <br> (quiet code) | 0000 h | $80 h$ | FFh | D5h |

Table 1 - Quiet PCM Code Assignment
In Back-to-Back configuration, both echo cancellers are combined to implement a full duplex echo canceller. Therefore muting Echo Canceller A causes quiet code to be transmitted on Rout, while muting Echo Canceller B causes quiet code to be transmitted on Sout.

In Extended Delay configuration, both echo cancellers are cascaded to make one 128 ms echo
canceller. In this configuration, muting Echo Canceller A causes quiet code to be transmitted on Rout.

## Bypass:

The Bypass state directly transfers PCM codes from Rin to Rout and from Sin to Sout. When Bypass state is selected, the adaptive filter coefficients are reset to zero.

## Disable Adaptation:

When the Disable Adaptation state is selected, the adaptive filter coefficients are frozen at their current value. In this state, the adaptation process is halted however the MT9122 continues to cancel echo.

## Enable Adaptation:

In Enable Adaptation state, the adaptive filter coefficients are continually updated. This allows the echo canceller to model the echo return path characteristics in order to cancel echo. This is the normal operating state.

## Controllerless Mode

The four functional states can be selected via S1, S2, S3, and S4 pins as shown in the following table.

| Echo <br> Canceller A <br> $\mathbf{S 2 / S 1}$ | Functional State | Echo <br> Canceller B <br> S4/S3 |
| :---: | :---: | :---: |
| 00 | Mute $^{(1)}$ | 00 |
| 01 | Bypass $^{(2)}$ | 01 |
| 10 | Disable Adaptation $^{(1,3)}$ | 10 |
| 11 | Enable Adaptation $^{(3)}$ | 11 |

(1) Filter coefficients are frozen (adaptation disabled)
(2) The adaptive filter coefficients are reset to zero
(3) The MT9122 cancels echo

Table 2 - Functional States Control Pins

## Controller Mode

The echo canceller functions are selected in Control Register 1 and Control Register 2 through four control bits: MuteS, MuteR, Bypass and AdaptDis. See Register Summary for details.

## MT9122 Throughput Delay

The throughput delay of the MT9122 varies according to the data path and the device configuration. For all device configurations, except for Bypass state, Rin to Rout has a delay of two frames and Sin to Sout has a delay of three frames.

In Bypass state, the Rin to Rout and Sin to Sout paths have a delay of two frames. In ST-BUS operation, the D and C channels have a delay of one frame.

## Power Down

Forcing the PWRDN pin to logic low, will put the MT9122 into a power down state. In this state all internal clocks are halted, the DATA1, Sout and Rout pins are tristated and the F0od, $\overline{\mathrm{TD} 1}$, and TD2 pins output high.

The device will automatically begin the execution of its initialization routines when the PWRDN pin is returned to logic high and a clock is applied to the MCLK pin. The initialization routines execute for one frame and will set the MT9122 to default register values.

## Device Configuration

The MT9122 architecture contains two individually controlled echo cancellers (Echo Canceller A and B). They can be set in three distinct configurations: Normal, Back-to-Back, and Extended Delay. See Figure 3.

## Normal Configuration:

In this configuration, the two echo cancellers (Echo Canceller A and B) are positioned in parallel, as shown in Figure 3a, providing 64 milliseconds of echo cancellation in two channels simultaneously.

In SSI operation, both channels are available in different timeslots on the same TDM (Time Division Multiplexing) bus. For Echo Canceller A, the ENA1 enable strobe pin defines the Rin/Sout (PORT1) time slot while the ENA2 enable strobe pin defines the $\mathrm{Sin} /$ Rout (PORT2) time slot. The ENB1 and ENB2 enable strobes perform the same function for Echo Canceller B.

In ST-BUS operation, the ENA1, ENA2, ENB1 and ENB2 pins are used to determine the PCM data format and the channel locations. See Table 4.

## Back-to-Back Configuration:

In this configuration, the two echo cancellers are positioned to cancel echo coming from both directions in a single channel providing full duplex 64 millisecond echo-cancellation. See Figure 3c. This configuration uses only one timeslot on PORT1 and PORT2, allowing a no-glue interface for applications where bidirectional echo cancellation is required.

In SSI operation, ENA1 and ENA2 enable pins are used to strobe data on Rin/Sout and Sin/Rout respectively. In ST-BUS operation, ENA1, ENA2, ENB1 and ENB2 inputs are used to select the STBUS mode according to Table 4.

Examples of Back-to-Back configuration include positioning the MT9122 between a codec and a transmission device or between two codecs for echo control on analog trunks.

## Extended Delay configuration:

In this configuration, the two echo cancellers are internally cascaded into one 128 millisecond echo canceller. See Figure 3b. In SSI operation, ENA1 and ENA2 enable pins are used to strobe data on Rin/Sout and Sin/Rout respectively. In ST-BUS operation, ENA1, ENA2, ENB1 and ENB2 inputs are used to select the ST-BUS mode according to Table 4.

## Controllerless Mode

The three configurations can be selected through the CONFIG1 and CONFIG2 pins as shown in the following table.

| CONFIG1 | CONFIG2 | CONFIGURATION |
| :---: | :---: | :---: |
| 0 | 0 | (selects Controller Mode) |
| 0 | 1 | Extended Delay Mode |
| 1 | 0 | Back-to-Back Mode |
| 1 | 1 | Normal Mode |

Table 3 - Configuration in Controllerless Mode

## Controller Mode

In Control Register 1, the Normal configuration can be programmed by setting both BBM and ExtendedDelay bits to 0 . Back-to-Back configuration can be programmed by setting the BBM bit to 1 and Extended-Delay bit to 0 . Extended-Delay configuration can be programmed by setting the Extended-Delay bit to 1 and BBM bit to 0 . Both BBM and Extended-Delay bits in Control Register 1 can not be set to 1 at the same time.

## PCM Data I/O

The PCM data transfer for the MT9122 is provided through two PCM ports. PORT1 consists of Rin and Sout pins while PORT2 consists of Sin and Rout Pins. The Data is transferred through these ports according to either ST-BUS or SSI conventions. The device determines the mode of operation by monitoring the signal applied to the FOi pin. When a
valid ST-BUS frame pulse is applied to the FOi pin, the MT9122 will assume ST-BUS operation. If FOi is tied continuously to Vss the MT9122 will assume SSI operation.

## ST-BUS Operation

The ST-BUS PCM interface conforms to Zarlink's STBUS standard and it is used to transport 8 bit companded PCM data (using one timeslot) or 16 bit 2's complement linear PCM data (using two timeslots). Pins ENA1 and ENB1 select timeslots on PORT1 while pins ENA2 and ENB2 select timeslots on PORT2. See Table 4 and Figures 5 to 8.

| PORT1 <br> Rin/Sout |  | ST-BUS Mode Selection | PORT2 <br> Sin/Rout |  |
| :---: | :---: | :---: | :---: | :---: |
| Enabl | e Pins |  | Enabl | Pins |
| ENB1 | ENA1 |  | ENB2 | ENA2 |
| 0 | 0 | Mode 1.8 bit companded PCM I/O on timeslots 0 \& 1 . | 0 | 0 |
| 0 | 1 | Mode 2. 8 bit companded PCM I/O on timeslots 2 \& 3. | 0 | 1 |
| 1 | 0 | Mode 3.8 bit companded PCM I/O on timeslots 2 \& 3 . Includes D \& C channel bypass in timeslots $0 \& 1$. | 1 | 0 |
| 1 | 1 | Mode 4. 16 bit 2's complement linear PCM I/O on timeslots 0-3. | 1 | 1 |

Table 4 - ST-BUS Mode Select
Note that if the device is in back-to-back or extended delay configurations, the second timeslot in any STBUS Mode contains undefined data. This means that the following timeslots contain undefined data: timeslot 1 in ST-BUS Mode 1; timeslot 3 in ST-BUS Modes 2 \& 3 and timeslots 2 and 3 in ST-BUS Mode 4.

## SSI Operation

The SSI PCM interface consists of data input pins (Rin, Sin), data output pins (Sout, Rout), a variable rate bit clock (BCLK), and four enable pins (ENA1,ENB1, ENA2 and ENB2) to provide strobes for data transfers. The active high enable may be either 8 or 16 BCLK cycles in duration. Automatic detection of the data type (8 bit companded or 16 bit 2's complement linear) is accomplished internally. The data type cannot change dynamically from one frame to the next.

In SSI operation, the frame boundary is determined by the rising edge of the ENA1 enable strobe (see Figure 9). The other enable strobes (ENB1, ENA2
and ENB2) are used for parsing input/output data and they must pulse within 125 microseconds of the rising edge of ENA1. If they are unused, they must be tied to Vss.

In SSI operation, the enable strobes may be a mixed combination of 8 or 16 BCLK cycles allowing the flexibility to mix 2's complement linear data on one port (e.g., Rin/Sout) with companded data on the other port (e.g., Sin/Rout).

| Enable Strobe Pin | Echo Canceller | Port |
| :---: | :---: | :---: |
| ENA1 | A | 1 |
| ENB1 | B | 1 |
| ENA2 | A | 2 |
| ENB2 | B | 2 |

Table 5 - SSI Enable Strobe Pins

## PCM Law and Format Control (LAW, FORMAT)

The PCM companding/coding law used by the MT9122 is controlled through the LAW and FORMAT pins. ITU-T G. 711 companding curves for $\mu$-Law and A-Law are selected by the LAW pin. PCM coding ITU-T G. 711 and Sign-Magnitude are selected by the FORMAT pin. See Table 6.

| PCM Code | Sign-Magnitude <br> FORMAT $=0$ | ITU-T (G.711) <br> FORMAT=1 |  |
| :---: | :---: | :---: | :---: |
|  | $\mu / A-L A W$ <br> LAW $=0$ or 1 | $\mu-L A W$ <br> LAW $=0$ | A-LAW <br> LAW $=1$ |
|  | 11111111 | 10000000 | 10101010 |
| + Zero | 10000000 | 11111111 | 11010101 |
| - Zero | 00000000 | 01111111 | 01010101 |
| - Full Scale | 01111111 | 00000000 | 00101010 |

Table 6 - Companded PCM

## Linear PCM

The 16-bit 2's complement PCM linear coding permits a dynamic range beyond that which is specified in ITU-T G. 711 for companded PCM. The echo-cancellation algorithm will accept 16 bits 2's complement linear code which gives a dynamic range of +15 dBm 0 . Note however that the tone detectors must be limited to the maximum dynamic range specified in G .711 ( +3.14 or +3.17 dBm 0 ).

Linear PCM data must be formatted as 14-bit, 2's complement data with three bits of sign extension in the most significant positions (i.e.: S,S,S,12,11, $\ldots 1,0$ ) for a total of 16 bits where " S " is the extended sign bit. When A-Law is converted to 2's complement linear format, it must be scaled up by 6 dB (i.e. left shifted one bit) with a zero inserted into the least significant bit position. See Figure 8.

## Bit Clock (BCLK/C4i)

The BCLK/C4i pin is used to clock the PCM data in both SSI (BCLK) and ST-BUS ( $\overline{\mathrm{C4i}})$ operations.

In SSI operation, the bit rate is determined by the BCLK frequency. This input must contain either eight or sixteen clock cycles within the valid enable strobe window. BCLK may be any rate between 128 KHz to 4.096 MHz and can be discontinuous outside of the enable strobe windows defined by ENA1, ENB1, ENA2 and ENB2 pins. Incoming PCM data (Rin, Sin) are sampled on the falling edge of BCLK while outgoing PCM data (Sout, Rout) are clocked out on the rising edge of BCLK. See Figure 17.

In ST-BUS operation, connect the system $\overline{\mathrm{C} 4}$ (4.096MHz) clock to the C4i pin.

## Master Clock (MCLK)

A nominal 20 MHz master clock (MCLK) is required for execution of the MT9122 algorithms. The MCLK input may be asynchronous with the 8 KHz frame. If only one channel operation is required, (Echo Canceller A only) the MCLK can be as low as 9.6 MHz .

## Microport

The serial microport provides access to all MT9122 internal read and write registers and it is enabled when CONFIG1 and CONFIG2 pins are both set to logic 0 . This microport is compatible with Intel MCS51 (mode 0), Motorola SPI (CPOL=0, CPHA=0), and National Semiconductor Microwire specifications. The microport consists of a transmit/receive data pin (DATA1), a receive data pin (DATA2), a chip select pin ( $\overline{\mathrm{CS}}$ ) and a synchronous data clock pin (SCLK).

The MT9122 automatically adjusts its internal timing and pin configuration to conform to Intel or Motorola/ National requirements. The microport dynamically senses the state of the SCLK pin each time $\overline{\mathrm{CS}}$ pin becomes active (i.e. high to low transition). If SCLK pin is high during $\overline{C S}$ activation, then Intel mode 0
timing is assumed. In this case DATA1 pin is defined as a bi-directional (transmit/receive) serial port and DATA2 is internally disconnected. If SCLK is low during $\overline{C S}$ activation, then Motorola/National timing is assumed and DATA1 is defined as the data transmit pin while DATA2 becomes the data receive pin. The MT9122 supports Motorola half-duplex processor mode ( $\mathrm{CPOL}=0$ and $\mathrm{CPHA}=0$ ). This means that during a write to the MT9122, by the Motorola processor, output data from the DATA1 pin must be ignored. This also means that input data on the DATA2 pin is ignored by the MT9122 during a valid read by the Motorola processor.

All data transfers through the microport are two bytes long. This requires the transmission of a Command/ Address byte followed by the data byte to be written or read from the addressed register. CS must remain low for the duration of this two-byte transfer. As shown in Figures 10 and 11, the falling edge of CS indicates to the MT9122 that a microport transfer is about to begin. The first 8 clock cycles of SCLK after the falling edge of $\overline{C S}$ are always used to receive the Command/Address byte from the microcontroller. The Command/Address byte contains information detailing whether the second byte transfer will be a read or a write operation and at what address. The next 8 clock cycles are used to transfer the data byte between the MT9122 and the microcontroller. At the end of the two-byte transfer, $\overline{\mathrm{CS}}$ is brought high again to terminate the session. The rising edge of $\overline{\mathrm{CS}}$ will tri-state the DATA1 pin. The DATA1 pin will remain tristated as long as $\overline{C S}$ is high.

Intel processors utilize Least Significant Bit (LSB) first transmission while Motorola/National processors use Most Significant Bit (MSB) first transmission. The MT9122 microport automatically accommodates these two schemes for normal data bytes. However, to ensure timely decoding of the R/W and address information, the Command/Address byte is defined differently for Intel and Motorola/National operations. Refer to the relative timing diagrams of Figures 10 and 11.

Receive data is sampled on the rising edge of SCLK while transmit data is clocked out on the falling edge of SCLK. Detailed microport timing is shown in Figure 19 and Figure 20.

| Function | Controllerless <br> selected when pins CONFIG1 \& $2 \neq 00$ | Controller <br> selected when pins CONFIG1 \& 2 = 00 |
| :---: | :---: | :---: |
| Normal Configuration | Set pins CONFIG1 to 1 and CONFIG2 1 to select this configuration. | Set bits Extended-Delay to 0 and BBM to 0 in Control Register 1 to select. |
| Back-to-Back Configuration | Set pins CONFIG1 to 1 and CONFIG2 to 0 to select this configuration. | Set bit BBM to 1 in Control Register 1 to select. |
| Extended Delay Configuration | Set pins CONFIG1 to 0 and CONFIG2 to 1 to select this configuration. | Set bit Extended-Delay to 1 in Control Register 1 to select. |
| Mute | Set pins S2/S1 to 00 and S4/S3 to 00 to select for Echo Canceller A and Echo Canceller B respectively. | Set bit MuteR to 1 or MuteS to 1 in Control Register 2 to select. |
| Bypass | Set pins S2/S1 to 01 and S4/S3 to 01 to select for Echo Canceller A and Echo Canceller B, respectively. | Set bit Bypass to 1 in Control Register 1 to select. |
| Disable Adaptation | Set pins S2/S1 to 10 and S4/S3 to 10 to select for Echo Canceller A and Echo Canceller B, respectively. | Set bit AdaptDis to 1 in Control Register 1 to select. |
| Enable Adaptation | Set pins S2/S1 to 11 and S4/S3 to 11 to select for Echo Canceller A and Echo Canceller B, respectively. | Set bits AdaptDis to 0 and Bypass to 0 in Control Register 1 to select. |
| SSI | Tie pin $\overline{\mathrm{FOi}}$ to VSS to select. | Tie pin $\overline{\mathrm{FOi}}$ to VSS to select. |
| ST-BUS | Apply a valid ST-BUS frame pulse to FOi pin to select. | Apply a valid ST-BUS frame pulse to FOi pin to select. |
| 12dB Attenuator | Always disabled. | Set bit PAD to 1 in Control Register 1 to enable. |
| Double-Talk Detector | Continuously enabled which disables filter adaptation when double-talk is detected. | The detection threshold can be controlled via Double-Talk Detection Threshold Register 1 and 2. |
| Disable Tone Detector | It is continuously enabled and puts TD1 or TD2 or both into active low when disable tone is detected. The TD1 and TD2 outputs have to be externally manipulated by the user to bypass the echo canceller. | Set bit TDis to 1 in Control Register 2 to disable tone detectors. |
| Disable Tone | Set pin REV to 1 to select disable tone with phase reversal (G.165). | Set bit PHDis to 1 in Control Register 2 to select disable tone without phase reversal (G164). |
| Non-Linear Processor | Set pin NLP to 1 to enable. | Set bit NLPDis to 1 to disable. |
| PCM Law | Set pin LAW to 1 or 0 to select A-Law or $\mu$-Law respectively. | Set pin LAW to 1or 0 to select A-Law or $\mu$-Law respectively. |
| PCM Format | Set pin FORMAT to 0 or 1 to select Sign-Magnitude or ITU-T format respectively. | Set pin FORMAT to 0 or 1 to select Sign-Magnitude or ITU-T format respectively. |
| Narrow-Band Signal Detector | Continuously enabled which disables the filter adaptation when narrow band signal is detected. | Set bit NBDis to 1 in Control Register 2 to disable. |
| Offset Null Filter | Continuously enabled which removes the DC component in the PCM input. | Set bit HPFDis to 1 in Control Register 2 to disable. |

Note: Bits marked with " 0 " are reserved bits and should be written "0".

The Exponential Decay registers (Decay Step Number and Decay Step Size) and Flat Delay register allow the LMS adaptation step-size (MU) to be programmed over the length of the FIR filter. A programmable MU profile allows the performance of the echo canceller to be optimized for specific applications. For example, if the characteristic of the echo response is known to have a flat delay of several milliseconds and a roughly exponential decay of the echo impulse response, then the MU profile can be programmed to approximate this expected impulse response thereby improving the convergence characteristics of the adaptive filter. Note that in the following register descriptions, one tap is equivalent to $125 \mu \mathrm{~s}(64 \mathrm{~ms} / 512$ taps $)$.
$F D_{7-0} \quad$ Flat Delay: This register defines the flat delay of the MU profile, (i.e., where the $M U$ value is $2^{-16}$ ). The delay is defined as $\mathrm{FD}_{7-0} \times 8$ taps. For example; if $F D_{7-0}=5$, then $\mathrm{MU}=2^{-16}$ for the first 40 taps of the echo canceller FIR filter. The valid range of $F D_{7-0}$ is: $0<=F D_{7-0}<=64$ in normal mode and $0<=F D_{7-0}<=128$ in extended-delay mode. The default value of $F D_{7-0}$ is zero.
$S^{2-0} \quad$ Decay Step Size Control: This register controls the step size (SS) to be used during the exponential decay of MU. The decay rate is defined as a decrease of MU by a factor of 2 every SS taps of the FIR filter, where $\mathbf{S S}=\mathbf{4} \mathbf{~ x 2}{ }^{\text {SSC2-0 }}$. For example; If $S S C_{2-0}=4$, then MU is reduced by a factor of 2 every 64 taps of the FIR filter. The default value of $\mathrm{SSC}_{2-0}$ is 04 h .
$\mathrm{NS}_{7-0} \quad$ Decay Step Number: This register defines the number of steps to be used for the decay of MU where each step has a period of SS taps (see SSC $_{2-0}$ ). The start of the exponential decay is defined as:
Filter Length (512 or 1024) - [ Decay Step Number (NS $\mathbf{F}_{7-0}$ ) x Step Size (SS) ] where SS = $4 \times \mathbf{x 2}^{\text {SSC2-0 }}$. For example, if $\mathrm{NS}_{7-0}=4$ and $\mathrm{SSC}_{2-0}=4$, then the exponential decay start value is $512-\left[\mathrm{NS}_{7-0} \times \mathrm{SS}\right]=512-\left[4 \times\left(4 \times 2^{4}\right)\right]=$ 256 taps for a filter length of 512 taps.

# For more information about all Zarlink products visit our Web Site at <br> www.zarlink.com 

Information relating to products and services furnished herein by Zarlink Semiconductor Inc. trading as Zarlink Semiconductor or its subsidiaries (collectively "Zarlink") is believed to be reliable. However, Zarlink assumes no liability for errors that may appear in this publication, or for liability otherwise arising from the application or use of any such information, product or service or for any infringement of patents or other intellectual property rights owned by third parties which may result from such application or use. Neither the supply of such information or purchase of product or service conveys any license, either express or implied, under patents or other intellectual property rights owned by Zarlink or licensed from third parties by Zarlink, whatsoever. Purchasers of products are also hereby notified that the use of product in certain ways or in combination with Zarlink, or non-Zarlink furnished goods or services may infringe patents or other intellectual property rights owned by Zarlink.

This publication is issued to provide information only and (unless agreed by Zarlink in writing) may not be used, applied or reproduced for any purpose nor form part of any order or contract nor to be regarded as a representation relating to the products or services concerned. The products, their specifications, services and other information appearing in this publication are subject to change by Zarlink without notice. No warranty or guarantee express or implied is made regarding the capability, performance or suitability of any product or service. Information concerning possible methods of use is provided as a guide only and does not constitute any guarantee that such methods of use will be satisfactory in a specific piece of equipment. It is the user's responsibility to fully determine the performance and suitability of any equipment using such information and to ensure that any publication or data used is up to date and has not been superseded. Manufacturing does not necessarily include testing of all functions or parameters. These products are not suitable for use in any medical products whose failure to perform may result in significant injury or death to the user. All products and materials are sold and services provided subject to Zarlink's conditions of sale which are available on request.

Purchase of Zarlink $s I^{2} C$ components conveys a licence under the Philips $I^{2} C$ Patent rights to use these components in and $I^{2} C$ System, provided that the system conforms to the $\mathrm{I}^{2} \mathrm{C}$ Standard Specification as defined by Philips.
